HGH or the Human Growth Hormone as it is also called is a hormone that is responsible for stimulating the growth and production of cells in animals and human beings. Somatotrophin is the growth hormone found in animals while the one found in humans is said to be the somatropin which is synthesized with the help of DNA technology. The HGH is mainly used to increase the height as the child grows throughout childhood besides treating a whole lot of diseases.

HGH or the Human Growth Hormone as it is also called is a hormone that is responsible for stimulating the growth and production of cells in animals and human beings. Somatotrophin is the growth hormone found in animals while the one found in humans is said to be the somatropin which is synthesized with the help of DNA technology. The HGH is mainly used to increase the height as the child grows throughout childhood besides treating a whole lot of diseases.

The Human Growth Hormone is mainly made use of to treat the deficiencies in growth hormones which may differ from one age to another. For instance, the

chief indicators of deficiencies in growth in children could be inability to grow, sexual immaturity and being extremely short for their age. In adults, you can measure deficiencies in growth from lack of bone mass, energy, strength and an amplified cardiovascular risk. To check whether a person is suffering from growth deficiency he or she is put through some tests which give an insight into the work their pituitary gland is doing. Doctors normally use a kind of stimulus to rouse the emission of the HGH in a bid to measure the deficiency.

A few of the more contentious uses of the HGH have been for the treatment of remission in multiple sclerosis, treatment in order to reverse the aging process in older people, treatment to increase weight loss in obese people, treat fibromyalgia, treat ulcerative colitis and Crohn's disease. The Human Growth Hormone is also used to treat idiopathic short stature, treatment for athletic enhancement as well as bodybuilding besides the use of the somatotropin animal hormone to raise the production of milk in cattle.

You will remember that at the last Olympiad, people who had never even heard of HGH got to know about it as star athletes were blamed of having taken the Human Growth Hormone to improve their performance in the sports. But it is said that even though the use of the HGH to improve sports performance or sports doping as it is also known as is forbidden by almost all professional sports associations and leagues, sports stars taking part in various sports have been caught to be using the Human Growth Hormone illegally. Although the sports stars are reported to be using this HGH to enhance their athletic performance, its effectiveness is yet to be measured but they do say it does improve athletic performance.

If you are a sports person you might be considering HGH so that you have an edge over your closest competitor. For the regular person looking to postpone old age, the Human Growth Hormone can prove to be a great tonic. There is definitely an overall improvement. Each person responds to the product in a different way so you cannot tell for sure how it will affect each individual. But often they are more energized, digest better, sleep better and have an increased libido.
